COE Message Processor(CMP)
Version 2.0.0.0 for Windows NT 4.0
Installation Procedure (IP)

Segment Installation:

The following steps describe how to install the CMP 2.0.0.0 onto a DII COE system.

Log on to DII Windows NT system as with system administration privileges so that the installation tool may be used.

Go to System Administration Program Group from the Start button and and pick 'DII Installer'.

Place the floppy disk 1 of 3 with the DII COE CMP 2.0.0.0 software into the floppy drive.

Pick the 'Source' Icon and make sure it is set to the appropriate drive, (A:\).
Click **"OK"**.

Pick the 'Read TOC' Icon. The Installer will read the floppy disk and should find the CMP segment.

When the *CMP Message Processor* segment label shows in the GUI; pick it with the mouse and then click the 'Install' Icon. Follow the directions to insert the remaining disks.

After segment is installed a popup window will appear to ask the user whether to automatically reboot the system. **Click "OK"** unless you want to reboot the system later. The software will not operate properly until after the system is rebooted.

This will create the directory /h/cmp and a CMP Icon in the System Administration group.

Reboot the system if you answered "Cancel" to the reboot prompt earlier or in the event the system did not prompt you to reboot.

Select the *CMP Message Processor* icon via the Start button to start CMP.

A popup window will appear to request whether to start the Journal Advertiser, click **"OK"**.

A popup window will appear to request whether to start the Journal Server, click **"OK"**.

A popup window will appear to request whether to start the Discriminator, click **"OK"**.

The CUI user interface will appear. You are ready to use the CMP system.
